

friendly, cooperative, and Jupiter rules the arteries. That's why Ike recovers from his heart attacks so well, and other cases don't. He has excellent collateral compensation. The doctor who knows that can have great confidence and the client can also have great confidence. So you see, astrology can be of very great value.

## DIABETES

Now the same thing with diabetes. I said before that astrology will give you the clue to the "pseudos" and there are hundreds of thousands of diabetics today who are getting insulin who should not because there is nothing wrong with their pancreas. When I was out in California in 1950, a newspaper man came to me and he wanted to talk to me about astrology and give me some publicity. I said, "Oh, I don't need it; talk to the local people." He put his hands in his pocket and pulled out a vial of insulin. I said, "Oh, you want a little help. I better look your case up." So I went and looked at an ephemeris and I said, "You're not a diabetic; you shouldn't have that." He was going blind. He said, "Well, it is funny; this stuff upsets me no end." Now there is a fact that is not generally perceived, and that is that the carbohydrate metabolism is not controlled exclusively by the pancreas. You have the privilege of distinguishing that in the twinkling of an eye if you know your astrology because Cancer rules the posterior pituitary, and patients who have afflictions there have either too much or too little of the hormones. That's what needs to be treated, not the pancreas. Now, if you want to find out the functions of the pituitary, you're going to have an awful lot of trouble. But astrologically, you can find it quickly. When you see one case after another, it doesn't matter what anybody says. No matter how mistaken they think I am, I know from sheer experience. I know one man who had 3% sugar. He happened to get into a hospital, and when they found what his sugar was, they ordered him on insulin at once. Well, he wouldn't take insulin and he hasn't had it yet, and he gets along on a very good diet. What is the answer? He is not a pancreatic type. He's a pituitary type. And even at that, the pituitary was just atonic. And if he lives half way decently he gets along, and so he never has insulin. He has no involvements or crises, and it looks like a miracle, but it isn't. It's just simply that had a different type, and that's why you need to know that.

## PSYCHOSOMATIC ILLNESS

You can also have many cases due to mental or emotional disturbances that are not chemical and not mechanical, and if you
